

ABSTRACT

A zip fastener device for joining two strips of leather, a
method of producing the said device and a corresponding
article

5 The zip fastener device for joining two strips (2 and 3)
comprising two rows of teeth (4 and 5) able to engage with
each other mutually under the action of a slider (6) and
applied respectively to one of the edges (7 and 8) of each
of the said two strips (2 and 3), the material of at least
10 one of the two strips (2 and 3) being of the leather or
simulation leather type, characterised in that the said
strip is formed by a piece (9) folded in two, in that the
area forming a fold (10) is filled longitudinally with a rod
(11) of chosen thickness and in that the teeth (4 and 5) are
15 applied at least partially around the said fold area (10)
thus filled.
